

Light structure

Piero Fogliati

Can you make the light structure stand still?

Press the green Start button.

Use the knob to adjust the rotational speed of the moving light dot.

Switch on the overall light with the red button.

You see a moving band of light in mid-air, which changes as you move the knob. When you turn the light on, it appears as if the band is contained in a transparent cylinder. You can also see that the motor runs at a constant speed even though the speed of the band of light changes.

With this work, Fogliati truly demonstrates the radical use of light, not simply to illuminate a room or an object, but used in its essence and “consistency” to create veritable sculptures of pure light.

The original name of this piece of art by Piero Fogliati from 1968 is Fotostruttura.
