

Lightwire

Can you see more than one line in the lights on the panel?

Press the green button.

Look at the dark green panel among the roof beams with the line of red lights and shake your head very rapidly. What can you see?

The red lights on the panel form different characters, when you shake your head.

The symbols on the rotating drum are transmitted to the red lights among the roof: they show vertical slices of the characters, one after the other. If you don't move your head, all these slices hit the same place in your eye. Your photoreceptors aren't able to resolve changes that fast. Moving your head means that each slice falls next to the previous one in your eye, and so the whole symbol is drawn in your eye.
