

Ball tryouts

Can you throw the ball at the bottle?

Throw the ball at the bottle until you hit it several times.

Look through the glasses with the special lenses and throw the ball at the bottle again until you hit it several times.

Try again without the glasses.

With the glasses on, you probably missed the bottle first, because the prisms in the glasses shift your view to the side. The bottle appears to be in a different location. When you are aiming using this shifted view, you will throw the ball next to the bottle. But with a few tries you can learn to correct for the shift and hit the bottle with the ball again. However, if you try again without the glasses, you will miss the bottle until you learn to correct your throw again.
